

# RIR RDAP Profile & Related Standardization Work

Registration Operations Workshop 12  
20 June 2023

# What is the RIR RDAP Profile?

- A set of additional requirements past those from the base RDAP documents
- Similar purpose to the ICANN gTLD RDAP Profile
- Available at  
<https://www.iana.org/assignments/rdap-extensions/rdap-extensions.xhtml>

# Why is it useful?

- The base RDAP documents are very flexible
- Additional requirements can be placed on RIR implementations and number implementations more generally
- These requirements/conditions help to ease the burden on client implementors

# History

Registered  
with IANA  
**Jan 2021**

 **APNIC**  
**Apr 2022**

 **RIPE NCC**  
RIPE NETWORK COORDINATION CENTRE  
**Feb 2023**

**Mar 2022**

  
American Registry for Internet Numbers

**Nov 2022**

  
The Internet Numbers Registry for Africa

# Query resolution (RFC 9224)

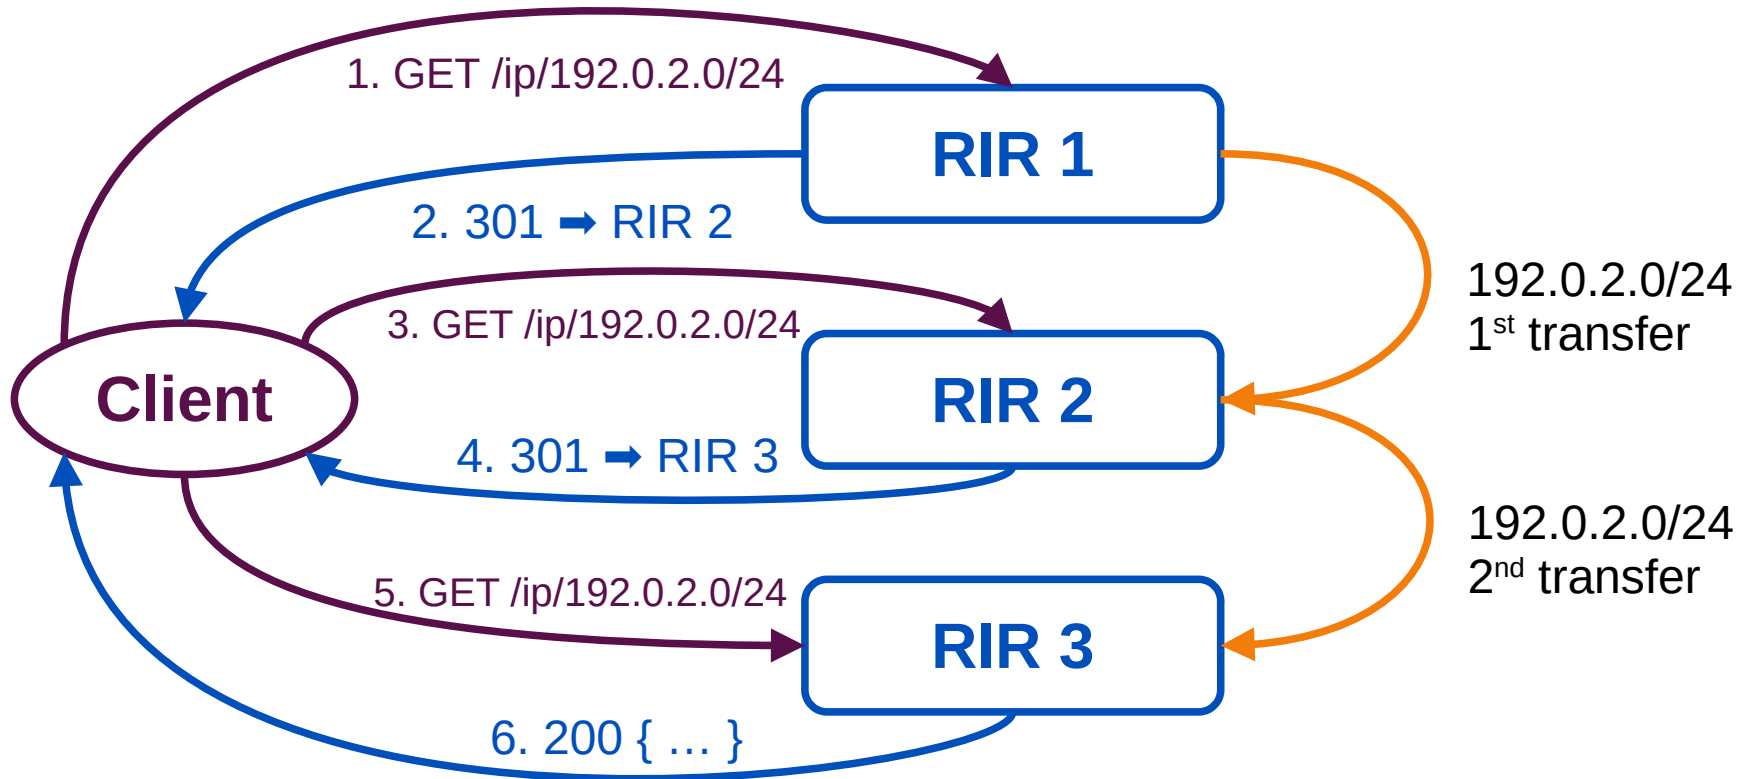

- Client retrieves bootstrap file from IANA
- Contains delegations from IANA to RIRs and the RDAP server to query
- Does not define server behaviour where resources have been transferred

```
{
  "description": "RDAP bootstrap file for IPv4
address allocations",
  "publication": "2019-06-07T19:00:02Z",
  "services": [
    [
      "41.0.0.0/8",
      "102.0.0.0/8",
      "105.0.0.0/8",
      "154.0.0.0/8",
      "196.0.0.0/8",
      "197.0.0.0/8"
    ],

  "endAutnum": 64511,  
  "status": "administrative",  
  "rdapConformance":  
    [ "nro_rdap_profile_asn_hierarchical_0", ... ],  
  ... }
```

# Notices

- Required notices
  - Terms of service
    - The conditions under which the service can be used
  - Inaccuracy reporting
    - A URL for reporting issues with results
- General improvement in consistency

# jCard profiling

- jCard (RFC 7095) is a JSON formatting for vCard (RFC 6350)
- vCard is used to represent contact details
  - Lots of options and flexibility: 74-page specification
  - Much of this unnecessary in the RDAP context
- The profile limits jCard usage to the union of what the RIRs were using at the time of writing, plus internationalization features

# Delegated services

- Typically operated by NIRs
  - Relevant to APNIC and LACNIC
  - Could be used to support general rwhois-type use cases
- The RDAP service handling the redirect includes its own data about the resource along with the redirect
- No guarantees as to conformance of delegated services

# Related standardization work (1)

- **draft-ietf-regext-rdap-reverse-search**
  - Supports operations like finding resources associated with a given contact
  - Most RIRs provide this functionality today via their Whois services

# Related standardization work (2)

- **draft-ietf-regext-rdap-rir-search**
  - Basic IP/ASN search
  - Reverse search extensions for IP/ASN records
  - Searches for more-specific and less-specific resources

# Questions?
